The objective of this study is to make a detailed analysis of the total factor productivity of the banks operating in the Turkish banking industry from 2003 to 2014. We used the panel data of 42 banks and applied the Malmquist Total Factor Productivity Index method separately for each year. We then calculated the pure efficiency change,

The Malmquist Productivity Index (MPI) suggests a convenient way of measuring the productivity change of a given unit between two consequent time periods. Until now, only a static approach for analyzing the MPI was available in the literature. However, this hides a potentially valuable information given by the evolution of productivity over time.
