Like us, birds need to breathe air in and out of their lungs. This is in order to fulfill the cycle of bringing oxygen into the body – to be used in metabolism – and also to take the waste CO 2 away from the body. However, unlike us, when a bird breathes – the air does not go simply in and out of the lungs in a simple “U-shaped” path.

The respiratory system of birds is also used for communication through song. The “voice box” is the syrinx, a membranous structure at the lower end of the trachea. Sound is produced only when air flows outward across the syrinx.

**Respiratory system - Birds | Britannica**  
Like mammals, birds take in air and extract oxygen from it to supply body tissues, while fish respiration depends on getting the oxygen dissolved in water through organs called gills. But bird...

**How Birds Breathe - The New York Times**  
Outdoor air will be extremely helpful in clearing out the bird’s respiratory system. A veterinary visit is called for, as clearing the symptoms may not address the underlying problem. As in humans, a bird’s sinus cavities provide a perfect environment for the growth of various pathogens.

**Pet Bird Health - Labored Breathing and Respiratory Distress**  
The continuous inhalation of bird dander can provoke asthma-like symptoms and a decline in lung capacity in humans 2. Hypersensitivity pneumonitis may also be referred to as bird-fancier’s lung. Symptoms include fatigue, a loss of energy, and progressive shortness of breath. If you suspect bird-fancier’s lung has developed, consult a physician.

**Bird Allergy Symptoms | Healthfully**  
Safety Exposing Your Bird to Essential Oils . As long as you have the go-ahead from your vet, there are a few ways to safely use confirmed-non-toxic essential oils sparingly without harming your bird. Diffuser: One common way to use essential oils around your bird is with a cold air diffuser. Oils such as geranium, lavender, and lemon are generally considered safer options, but confirm this with your vet before using them.

**Are Essential Oils Safe for Birds? - The Spruce Pets**  
When birds are forced to breathe air that is thick with dander and dust, as well as other normal household pollutants, it almost always leads to disease and infection which can shorten your bird’s lifespan considerably. Instinct allows birds to be able to effectively hide symptoms when they are ill.

Last Updated: 20th November, 2020 08:30 IST Gorilla In Zoo Tries To Breathe Life In Injured Bird, Pushes It To Fly; Watch A video of a gorilla is going viral on social media, where the huge creature can be seen helping a small bird, which appears to have fallen from the sky.

**Gorilla in zoo tries to breathe life in injured bird ...**  
When a bird takes in the air it travels through nostrils and travels to the posterior air sac and then through the trachea, it travels to their butts. Now when birds exhale it does not leave the body directly rather it goes to the anterior sacs and then to lungs where oxygen is absorbed while carbon dioxide is expelled out.

**Best 10 Ways, How Do Birds breathe? - Zoological World**  
Birds feature organs called air sacs that connect to their lungs. These air sacs extend into some of the hollow bones of birds and increase the amount of gas inside their bodies at all times. One big difference between avian respiration and mammalian respiration is that birds do not use a diaphragm to pump air in and out of their lungs.

**How Do Birds Breathe? - Reference.com**  
Amphibians require water to reproduce because, unlike reptiles and birds, their eggs lack an impervious shell. Some species of amphibians have adaptations that allow them to lay their eggs elsewhere, but the vast majority of amphibians require freshwater for their eggs.

**How Do Amphibians Breathe? - Earth.com**  
Birds breathe differently from mammals because they lack a diaphragm. They move air in and out of their lungs and air sacs by means of special muscles that move the ribs and sternum downward and forward, expanding the body cavity and causing inspiration, and then up and backward, contracting the body cavity and causing expiration.

**How birds breathe - BirdWatching**  
A bird can also use its air sacs to sing by forcing air through its vocal organs like a bagpipe. Some birds can sing while they fly! This is due in part to the bird’s ability to sing during inspiration as well as expiration (like whistling), as well as an incredible degree of muscle control.

**How Birds Breathe - Chickscope 1.5**  
Bird lungs do not expand or contract like the lungs of mammals. Unlike in mammals, air flows only in one direction and this allows birds to take in oxygen even as they exhale. Insects have no...
